

HOW TO TAKE A STILL PHOTO WITH YOUR WEBCAM

This is what the main interface will look like before detecting your webcam, with five menu options at the top of the window: “**File, Devices, Options, Capture and Help.**”

It will only take a few seconds for AMcap to activate your webcam. Once it does, you can take photos with this software by going to “**Capture**” and selecting “**Take picture.**”

When you click to take a picture, the image will be opened straight away in Windows Explorer, and from here all you have to do to save the image is open your favorite graphics program via “**Open**” in Windows Explorer.
